PAPER 2 (SECTION A)

Question		Answer				Mark
A1	a					2
		trend	only true down a group	only true across a period	true for both	
		The number of electron shells increases.	✓			
		The number of valency electrons increases.		✓		
		Proton number increases.			✓	
		There is a change in character from metallic to non-metallic.		✓		
		[2 correct – 1 mark]				

	bi	Melting point decreases down Group I and increases down Group VII.	1
	bii	Reactivity increases down Group I and decreases down Group VII.	1
	c	Catalysts <u>increase the rate of reaction</u> hence the <u>industrial processes can be completed in a shorter time</u>. This will help to <u>reduce energy usage</u> and save costs. Only a small amount of catalysts is needed and they <u>remain chemically unchanged and unchanged in mass</u> at the end of the reaction, so they can be <u>reused indefinitely</u> and there is no recurring costs. Hence, they reduce costs in the long run.	1 1
A2	a	Rusting involves oxidation. The <u>oxidation state of iron increases from 0 in Fe to +3 in Fe₂O₃</u>. Extraction involves reduction. The <u>oxidation state of iron decreases from +3 in Fe₂O₃ to 0 in Fe</u>.	1 1
	bi	An alloy is a homogeneous <u>mixture of metal with (small amounts of) other elements</u> .	1
	bii	The oil, the paint and the plastic coating <u>acts as a protective layer to prevent the iron parts of the bicycle from rusting</u> as they <u>prevent the iron from being exposed to water and oxygen</u> .	1 1
	biii	<u>Zinc is more reactive than iron</u> and hence its atoms will <u>lose electrons more readily</u> and <u>corrodes in place of iron</u> .	1 1
	a	The actual surface temperature of Mercury is <u>close to its predicted surface temperature</u> as there is <u>no atmosphere of gases</u>. [must state but no marks] The actual surface temperatures of Earth and Venus are higher than their predicted surface temperatures. This is because their atmospheres contain <u>carbon dioxide which is a greenhouse gas</u>. Carbon dioxide <u>traps excess heat</u> which increases the surface temperature. The <u>difference between the actual surface temperature and predicted surface temperature is much higher for Venus than Earth (by 500°C)</u> as the atmosphere of <u>Venus contains 97% carbon dioxide</u> but the atmosphere of <u>Earth contains only 0.04% carbon dioxide</u>.	1 1

	bi	Volcanic eruptions	1																
	bii	The pH of the water will be low/ less than 7.	1																
	biii	The <u>surface temperature of Venus is too high at 462°C hence the water would have boiled as its boiling point is 100°C and formed steam/water vapour.</u>	1																
	ci	Plants undergo <u>photosynthesis</u> where they <u>take in carbon dioxide and release oxygen.</u> Hence the <u>percentage of carbon dioxide decreased and the percentage of oxygen increased.</u>	1																
	cii	Increase in industrial activities, use of machinery and vehicles which results in <u>increased combustion of fossil fuels or carbon containing fuels which releases (excess) carbon dioxide.</u>	1																
	ciii	Carbon dioxide:  Oxygen: 	2 1																
A4	a	<table> <thead> <tr> <th>name of salt</th><th>formula of salt</th><th>name of acid used to make salt</th><th>name of other compound used to make salt</th></tr> </thead> <tbody> <tr> <td>potassium sulfate</td><td>K_2SO_4</td><td>sulfuric acid</td><td>potassium hydroxide</td></tr> <tr> <td>potassium phosphate</td><td>K_3PO_4</td><td>phosphoric acid</td><td>potassium hydroxide</td></tr> <tr> <td>ammonium nitrate</td><td>NH_4NO_3</td><td>nitric acid</td><td>ammonium carbonate/ aqueous ammonia</td></tr> </tbody> </table>	name of salt	formula of salt	name of acid used to make salt	name of other compound used to make salt	potassium sulfate	K_2SO_4	sulfuric acid	potassium hydroxide	potassium phosphate	K_3PO_4	phosphoric acid	potassium hydroxide	ammonium nitrate	NH_4NO_3	nitric acid	ammonium carbonate/ aqueous ammonia	4

		calcium phosphate Ca₃(PO₄)₂ phosphoric acid calcium hydroxide																																									
		[1 mark per row]																																									
	b	NH ₄ NO ₃ and K ₃ PO ₄	1																																								
	ci	Salt: Ca ₃ (PO ₄) ₂ Reason: It contains phosphorus but does not contain nitrogen and potassium.	1 1																																								
	cii	M _r of K ₃ PO ₄ = 3(39) + 31 + 4(16) = 212 % by mass of K = [3(39) / 212] x 100% = 55.2% % by mass of P = [31 / 212] x 100% = 14.6% % by mass of N = 0.00% Ratio of N : P : K = 0 : 15 : 55	1 1 1																																								
A5	a	Salts: silver chloride, barium sulfate, lead sulfate [3 correct – 2 marks, 2 correct – 1 mark, 1 correct – 0 marks] Reason: They are <u>insoluble salts</u> and hence can be prepared by adding two soluble reactants together.	2 1																																								
	b	<table><tr><th rowspan="2">compound</th><th colspan="5">use</th></tr><tr><th>to make detergents</th><th>to make polymers for packaging</th><th>for flue gas desulfurisation</th><th>as a solvent in inks</th><th>for road surfaces</th></tr><tr><td>bitumen</td><td></td><td></td><td></td><td></td><td>✓</td></tr><tr><td>sulfuric acid</td><td>✓</td><td></td><td></td><td></td><td></td></tr><tr><td>ethene</td><td></td><td>✓</td><td></td><td></td><td></td></tr><tr><td>ethyl ethanoate</td><td></td><td></td><td></td><td>✓</td><td></td></tr><tr><td>calcium carbonate</td><td></td><td></td><td>✓</td><td></td><td></td></tr></table>	compound	use					to make detergents	to make polymers for packaging	for flue gas desulfurisation	as a solvent in inks	for road surfaces	bitumen					✓	sulfuric acid	✓					ethene		✓				ethyl ethanoate				✓		calcium carbonate			✓		
compound	use																																										
	to make detergents	to make polymers for packaging	for flue gas desulfurisation	as a solvent in inks	for road surfaces																																						
bitumen					✓																																						
sulfuric acid	✓																																										
ethene		✓																																									
ethyl ethanoate				✓																																							
calcium carbonate			✓																																								

		[5 correct – 3 marks, 4 or 3 correct – 2 marks, 2 correct – 1 mark, 1 correct – 0 marks]	
A6	a	- They have the same general formula $C_nH_{2n+1}CHO$. - They increase by a $-CH_2$ group down the homologous series. *They have the same functional group $-CHO$. [first two points are more essential. any two points – 1 mark each]	2
	b	Formula: C_3H_7CHO Predicted boiling point: $75^\circ C$ [between $70^\circ C$ to $80^\circ C$]	1 1
	ci	Isomers are <u>compounds with the same molecular formula but different structural formula</u>. Ethanol has a molecular formula of C_2H_6O and structural formula of CH_3CH_2OH. Methoxymethane has a molecular formula of C_2H_6O but different structural formula of CH_3OCH_3 from ethanol. Hence they both are isomers of each other. Ethanal has a molecular formula of C_2H_4O which is different from that of ethanol and methoxymethane hence it is not an isomer of the other two compounds.	1 1
	cii	$2C_2H_4O + 5O_2 \rightarrow 4CO_2 + 4H_2O$ Correct reactants and products [1 mark] Balanced equation [1 mark]	1 2
	ciii	$2 \begin{array}{c} H \\ \\ H-C-C \\ \quad \diagup \\ H \quad O \\ \quad \quad \diagdown \\ \quad \quad H \end{array} + O=O \rightarrow 2 \begin{array}{c} H \\ \\ H-C-C \\ \quad \diagup \\ H \quad O \\ \quad \quad \diagdown \\ \quad \quad O-H \end{array}$	1

PAPER 2 (SECTION B)

Question		Answer	Mark
B7	a	nylon X: Nylon 4, 6 nylon Y: Nylon 11	2 1
	b	$\begin{array}{c} \text{H}-\text{N}-(\text{CH}_2)_5-\text{N}-\text{H} \\ \qquad \qquad \\ \text{H} \qquad \qquad \text{H} \end{array} \qquad \begin{array}{c} \text{O} \qquad \qquad \text{O} \\ // \qquad \quad // \\ \text{H}-\text{O}-\text{C}-(\text{CH}_2)_8-\text{C}-\text{O}-\text{H} \\ \backslash \qquad \quad / \\ \text{O} \qquad \qquad \text{O} \end{array}$ [1 mark per product]	2
	c	M_r of repeating unit = $2(14) + 12(12) + 2(16) + 22 = 226$	1
		Minimum number of repeating units = $10000 / 226 = 45$	1
	d	Diamine: As the chain length of the diamine increases, the melting point decreases. The melting point nylon 4,6 is 275°C but the melting point of nylon 6,6 is 269°C.	1
		Dicarboxylic acid: As the chain length of the dicarboxylic acid increases, the melting point decreases. The melting point of nylon 6,6 is 269°C but melting point of nylon 6,10 and nylon 6,12 is 220°C and 218°C respectively.	1
		[Use of data to support reasoning]	1
B8	e	M_r of 1 repeating unit of nylon 6 = $6(12) + 11 + 14 + 16 = 113$ No. of moles of repeating units of nylon 6 in 1 kg = $1000/113 = 8.8496$ mol	1
		No. of moles of CO_2 = $8.8496 \times 6 = 53.0976$ mol	1
		M_r of CO_2 = $12 + 2(16) = 44$ Carbon footprint = $53.0976 \times 44 = 2336.29$ g = 2.34 kg (to 3 s.f.)	1
	a	$\text{N}_2 + 3\text{H}_2 \rightleftharpoons 2\text{NH}_3$	6 1

		By <u>Avogadro's law</u> , 1 mole of nitrogen reacts with 3 moles of hydrogen to form 2 moles of ammonia. Hence, the mole ratio is 1 : 3.	1																		
	bi	At a lower pressure, there are <u>fewer nitrogen and hydrogen molecules per unit volume</u> . This <u>decreases the frequency of effective collisions between the molecules and hence the rate of reaction decreases</u> .	1 1																		
	bii	From the graph, the <u>percentage yield of ammonia decreases as pressure decreases</u> . For example, at 500°C, the yield of ammonia is about 24% at 400 atm but is about 8% at 100 atm. Hence, there will be a <u>smaller volume of ammonia and larger volumes of unreacted nitrogen and hydrogen</u> leaving the main reactor.	1 1																		
	biii	There will be <u>no effect</u> on the final amount of ammonia formed. This is because the unreacted nitrogen and hydrogen gases will be recycled again to react to form ammonia.	1 1																		
EITHER B9	a	<table border="1"><thead><tr><th>solution</th><th colspan="2">name of products of electrolysis</th><th>ionic equation for reaction at each electrode</th></tr></thead><tbody><tr><td rowspan="2">concentrated aqueous copper(II) chloride</td><td>at negative electrode</td><td>copper metal</td><td>$\text{Cu}^{2+}(\text{aq}) + 2\text{e}^{-} \rightarrow \text{Cu}(\text{s})$</td></tr><tr><td>at positive electrode</td><td>chlorine gas</td><td>$2\text{Cl}^{-}(\text{aq}) \rightarrow \text{Cl}_2(\text{g}) + 2\text{e}^{-}$</td></tr><tr><td rowspan="2">dilute copper(II) sulfate</td><td>at negative electrode</td><td>copper metal</td><td>$\text{Cu}^{2+}(\text{aq}) + 2\text{e}^{-} \rightarrow \text{Cu}(\text{s})$</td></tr><tr><td>at positive electrode</td><td>oxygen gas</td><td>$4\text{OH}^{-}(\text{aq}) \rightarrow \text{O}_2(\text{g}) + 2\text{H}_2\text{O}(\text{l}) + 4\text{e}^{-}$</td></tr></tbody></table> [1 mark for each correct product + ionic equation] [State symbols not required for ionic equations]	solution	name of products of electrolysis		ionic equation for reaction at each electrode	concentrated aqueous copper(II) chloride	at negative electrode	copper metal	$\text{Cu}^{2+}(\text{aq}) + 2\text{e}^{-} \rightarrow \text{Cu}(\text{s})$	at positive electrode	chlorine gas	$2\text{Cl}^{-}(\text{aq}) \rightarrow \text{Cl}_2(\text{g}) + 2\text{e}^{-}$	dilute copper(II) sulfate	at negative electrode	copper metal	$\text{Cu}^{2+}(\text{aq}) + 2\text{e}^{-} \rightarrow \text{Cu}(\text{s})$	at positive electrode	oxygen gas	$4\text{OH}^{-}(\text{aq}) \rightarrow \text{O}_2(\text{g}) + 2\text{H}_2\text{O}(\text{l}) + 4\text{e}^{-}$	1 1 1 1
solution	name of products of electrolysis		ionic equation for reaction at each electrode																		
concentrated aqueous copper(II) chloride	at negative electrode	copper metal	$\text{Cu}^{2+}(\text{aq}) + 2\text{e}^{-} \rightarrow \text{Cu}(\text{s})$																		
	at positive electrode	chlorine gas	$2\text{Cl}^{-}(\text{aq}) \rightarrow \text{Cl}_2(\text{g}) + 2\text{e}^{-}$																		
dilute copper(II) sulfate	at negative electrode	copper metal	$\text{Cu}^{2+}(\text{aq}) + 2\text{e}^{-} \rightarrow \text{Cu}(\text{s})$																		
	at positive electrode	oxygen gas	$4\text{OH}^{-}(\text{aq}) \rightarrow \text{O}_2(\text{g}) + 2\text{H}_2\text{O}(\text{l}) + 4\text{e}^{-}$																		
	bi	A and D																			
	bii	Reagent A : When A is added to both copper(II) chloride and copper(II) sulfate, a <u>reddish brown solid</u> will be formed and the <u>solutions turn from blue to colourless</u> .	2																		

		Reagent B: When B is added to copper(II) chloride, a <u>white precipitate</u> will be formed. When B is added to copper(II) sulfate, there is <u>no visible change</u>. Reagent C: When C is added to copper(II) chloride, there is <u>no visible change</u>. When C is added to copper(II) sulfate, a <u>white precipitate</u> will be formed. Reagent D: When D is added to both copper(II) chloride and copper(II) sulfate, a <u>blue precipitate</u> will be formed.	1
OR	ai	A <u>reddish brown solid</u> will be formed.	1
B9		The <u>colour of the solution changes from blue to (pale) green gradually</u> .	1
	aii	Using a displacement reaction to extract copper is more economical. <u>Scrap iron which is low in cost</u> and may not be useful is used to extract copper metal, which can be <u>made into useful products</u> like wires, pipes, ornaments, etc. These products can then be <u>sold at higher costs</u>. Using a displacement reaction to extract copper is <u>more environmentally friendly</u> as the process <u>does not produce any pollutants such as carbon monoxide</u> as compared to using carbon to reduce the copper ore to copper (in a blast furnace). [Or any other acceptable reasons]	1
	b	$\text{Cl}_2(\text{g}) + 2\text{Br}^-(\text{aq}) \rightarrow 2\text{Cl}^-(\text{aq}) + \text{Br}_2(\text{aq})$ [1m] – ionic equation; [1m] – state symbols	2
	c	Similarities: - Both reactions involve a more reactive element displacing a less reactive element from its solution. - Both reactions involve a colour change in the solutions. Differences: - In extraction of copper, a solid is formed as one of the products but in extraction of bromine, the products are aqueous. - In extraction of copper, the more reactive element (i.e. Fe) is oxidised but in extraction of bromine, the more reactive element (i.e. Cl_2) is reduced.	1
