## 2025 Year 5 H2 Mathematics Timed Practice Paper

### Questions and Solutions with comments

#### General Comments

- A small number of students wrote the wrong Exam Index Number on their scripts. For example, 260227 was mistakenly written as 262027, which belongs to another actual student.  
 👉 Please **double-check your Index Number** before writing it down in future assessments.
- A significant number of scripts had solutions written outside the designated boxes for each part of the question.  
 ✖ Please note that for the actual A-level exams, your scripts will be digitally scanned, and any writing outside the boxes may not be captured.  
 👉 Always **keep your work within the provided boundaries**.
- A small number of students wrote their solutions for one question in the space of another question.  
 👉 **Do not do this**—there may be **different markers assigned to different questions**, and your answer may be **missed** if it is in the wrong place.
- A significant number of scripts that used Additional Page to write solutions did not indicate on the original allocated solution space to inform the marker to refer to the Additional Page.  
 👉 If you use an Additional Page, always **write “See Additional Page”** clearly in the allocated space, or the marker may **miss your continued work**.
- Most scripts were well presented, with clear and logical mathematical arguments. 👍  
 However, in some cases:
  - o the handwriting was difficult to read, or
  - o the writing was too small, making it illegible, or
  - o the ink was too light, making answers illegible
 🖋 **Reminder:** Markers can only award marks for work they can read. Please ensure your handwriting is **neat and legible**, and that you write at a **reasonable size**.

#### Solutions

- 1 Given that the curve  $y = ax + b|x|$  passes through  $(-1, -4)$  and intersects another curve  $y = cx - 3$  at  $x = -3$  and  $x = 3$ , find the values of  $a$ ,  $b$  and  $c$ . [4]

|     |                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                   |

- 2 Referred to an origin  $O$ , the position vectors of three points  $A$ ,  $B$  and  $C$  are  $3\mathbf{i} - 2\mathbf{j} + 5\mathbf{k}$ ,  $\mathbf{i} + 4\mathbf{j} - 2\mathbf{k}$  and  $\alpha\mathbf{i} + 2\mathbf{j} + 4\mathbf{k}$  respectively.
- (a) Determine the value of  $\alpha$  for which points  $O$ ,  $A$ ,  $B$  and  $C$  are coplanar. [2]
- (b) Given that  $\overrightarrow{OD} = \overrightarrow{OA} + \lambda\overrightarrow{OB}$ , find the value of  $\lambda$  for which  $\overrightarrow{OD}$  is perpendicular to the  $y$ -axis. [2]
- (c) Find the exact area of triangle  $OAD$ . [2]

- 4 It is given that  $2 + i$  is a root of the equation

$$2z^4 + az^3 + bz^2 + az - 15 = 0.$$

- (a) Find the values of the real numbers  $a$  and  $b$ , and without the use of a calculator, find the other roots of the equation. [6]
- (b) Deduce the roots of the equation

$$2w^4 + aiw^3 - bw^2 - aiw - 15 = 0. \quad [2]$$

- 6 (a) Express  $x^3 - 8$  in the form  $(x - 2)(ax^2 + bx + c)$ , where  $a$ ,  $b$  and  $c$  are constants to be determined. [1]
- (b) Without using a calculator, solve the inequality  $\frac{x^2}{x+1} \geq \frac{8}{x(x+1)}$ . [4]
- (c) Hence, solve  $\frac{(q+2)^2}{|q+2|+1} \geq \frac{8}{|q+2|(|q+2|+1)}$  [3]

- 7 A particle moves on the Cartesian plane in such a way that at time  $t$ , its position is given by the parametric equations  $x = t \cos t$ ,  $y = t \sin t$ . The particle starts moving from the origin.

(a) Find the equation of the normal to the path of the particle at  $t = \frac{\pi}{2}$ , leaving your answer in exact form. [5]

(b) It is given that the instantaneous speed of the particle at time  $t$  is defined as  $\sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2}$ .

(i) Find an expression for  $\sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2}$  in terms of  $t$ , giving your answer in its simplest form. [2]

(ii) Find the exact instantaneous speed of the particle when it crosses the positive  $x$ -axis for the first time. [2]

(iii) Explain if the particle will ever come to rest. [1]

- 8 A home interior designer is looking to design a pull-down wardrobe lift. To test his concept, the designer built a small-scale model of it, in which points  $(x, y, z)$  are defined relative to a corner of the model at  $O(0, 0, 0)$ . The rods used in the model can be modelled by equations of straight lines.

The main rod can be modelled by the line  $l_1$  with equation  $\mathbf{r} = \begin{pmatrix} 5 \\ -5 \\ 8 \end{pmatrix} + \lambda \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix}, \lambda \in \mathbb{R}$ .

Another rod, line  $l_2$ , passes through the points  $A(5, -5, 8)$  and  $B(8, -4, 3)$ .

- (a) A supporting wire connects  $B$  to a point  $F$  on  $l_1$  such that  $\overrightarrow{BF}$  is perpendicular to  $l_1$ . Find the position vector of  $F$ . [3]
- (b) A retractable rod, line  $l_R$ , is placed such that it can be modelled by reflecting  $l_2$  about  $l_1$ . Find a vector equation of  $l_R$ . [3]

The panels of the small-scale model can be modelled by equations of planes. The main panel, plane  $p_1$ , contains the main rod  $l_1$  and an attachment point  $C(0, 0, 6)$ .

- (c) Show that  $p_1$  can be represented by the cartesian equation  $-x + y + 5z = 30$ . [3]
- (d) A decorative plank, plane  $p_2$ , has equation  $p_2: -3x + \alpha y + 15z = \beta$ , where  $\alpha, \beta \in \mathbb{R}$ . If the distance between  $p_1$  and  $p_2$  is exactly  $3\sqrt{3}$  units, find the possible values of  $\alpha$  and  $\beta$ . [3]

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                         |

(d)  
[3]

$$p_2 : -3x + \alpha y + 15z = \beta \Rightarrow \mathbf{r} \cdot \begin{pmatrix} -3 \\ \alpha \\ 15 \end{pmatrix} = \beta$$

For non-zero distance between 2 planes,  $p_1$  is parallel to  $p_2$ . So, they have the same normal vector.

$$\begin{pmatrix} -1 \\ 1 \\ 5 \end{pmatrix} = k \begin{pmatrix} -3 \\ \alpha \\ 15 \end{pmatrix} \Rightarrow k = \frac{1}{3}, \alpha = 3$$

**Method 1: Length of Projection**

Let a point on  $p_2$  be  $D$ .

$$\text{Choose } \overrightarrow{OD} = \begin{pmatrix} -\frac{\beta}{3} \\ 0 \\ 0 \end{pmatrix}$$

$$\overrightarrow{CD} = \begin{pmatrix} -\frac{\beta}{3} \\ 0 \\ 0 \end{pmatrix} - \begin{pmatrix} 0 \\ 0 \\ 6 \end{pmatrix} = \begin{pmatrix} -\frac{\beta}{3} \\ 0 \\ -6 \end{pmatrix}$$

The distance between the 2 planes

= Length of projection of  $\overrightarrow{CD}$  onto the normal of the plane

$$\frac{\left| \begin{pmatrix} -\frac{\beta}{3} \\ 0 \\ -6 \end{pmatrix} \cdot \begin{pmatrix} -1 \\ 1 \\ 5 \end{pmatrix} \right|}{\left| \begin{pmatrix} -1 \\ 1 \\ 5 \end{pmatrix} \right|} = 3\sqrt{3}$$

$$\left| \frac{\beta}{3} - 30 \right| = 3\sqrt{3}(\sqrt{27})$$

$$\frac{\beta}{3} - 30 = \pm 27$$

$$\frac{\beta}{3} = 57 \quad \text{or} \quad \frac{\beta}{3} = 3$$

$$\beta = 171 \quad \text{or} \quad \beta = 9$$

|  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
