

			Y5 HL Mathematics Final Examination 2018
1	[Maximum mark: 5]		
		Well done except for some careless mistakes	$\left(\frac{1}{\sqrt{x}} - 1\right)^4 (1-x)^2$ $= \left[\left(\frac{1}{\sqrt{x}}\right)^4 + 4\left(\frac{1}{\sqrt{x}}\right)^3(-1) + \binom{4}{2}\left(\frac{1}{\sqrt{x}}\right)^2(-1)^2 + \binom{4}{3}\left(\frac{1}{\sqrt{x}}\right)^1(-1)^3 + (-1)^4 \right] \times [1 - 2x + x^2]$ $= \dots 1 + \binom{4}{2}\left(\frac{1}{\sqrt{x}}\right)^2(-2x) + \left(\frac{1}{\sqrt{x}}\right)^4(x^2) + \dots$ $= \dots 1 - \frac{2 \times 4!}{2!2!} + 1 + \dots$ $= 1 - 12 + 1$ $= -10$
2	[Maximum mark: 5]		
	(i)	Very well done	$\frac{1}{\sqrt{4r-3} + \sqrt{4r+1}}$ $= \frac{\sqrt{4r-3} - \sqrt{4r+1}}{(\sqrt{4r-3} + \sqrt{4r+1})(\sqrt{4r-3} - \sqrt{4r+1})}$ $= \frac{\sqrt{4r-3} - \sqrt{4r+1}}{4r-3 - (4r+1)}$ $= \frac{\sqrt{4r+1} - \sqrt{4r-3}}{4}$
	(ii)	Most tried to force an AP out of the series which is wrong	$= \frac{1}{4} \sum_{1}^{100} (\sqrt{4r+1} - \sqrt{4r-3})$ $= \frac{1}{4} [(\sqrt{5} - \sqrt{1}) + (\sqrt{9} - \sqrt{5}) + (\sqrt{13} - \sqrt{9}) + (\sqrt{17} - \sqrt{13}) \dots + (\sqrt{401} - \sqrt{397})]$ $= \frac{1}{4} [-1 + \sqrt{401}]$
3	[Maximum mark: 5]		
		Many did not realise that $1 - \tan\theta > 0$ and can be multiplied for simple solving. Most did not remember $-\frac{\pi}{4} < \theta < \frac{\pi}{4}$ as the necessary condition	$-\frac{\pi}{4} < \theta < \frac{\pi}{4} \Rightarrow -1 < \tan\theta < 1$ $S_{\infty} = \frac{1}{1 - \tan\theta}$ $S_{\infty} < \frac{3 + \sqrt{3}}{2}$ $\frac{1}{1 - \tan\theta} < \frac{3 + \sqrt{3}}{2}$ $2 < (3 + \sqrt{3})(1 - \tan\theta) \quad [\text{since } \tan\theta < 1]$ $2 - 3 + 3\tan\theta - \sqrt{3} + \sqrt{3}\tan\theta < 0$ $-1 + 3\tan\theta - \sqrt{3} + \sqrt{3}\tan\theta < 0$ $(3 + \sqrt{3})\tan\theta < 1 + \sqrt{3}$

			$\tan\theta < \frac{1+\sqrt{3}}{3+\sqrt{3}}$ $\tan\theta < \frac{(1+\sqrt{3})(3-\sqrt{3})}{(3+\sqrt{3})(3-\sqrt{3})}$ $\tan\theta < \frac{3+2\sqrt{3}-3}{6}$ $\tan\theta < \frac{\sqrt{3}}{3}$ $\theta < \frac{\pi}{6}$ Hence $-\frac{\pi}{4} < \theta < \frac{\pi}{6}$
4	[Maximum mark: 6]		
		Implicit differentiation is ok but some had misread question as $\frac{dy}{dx} = 1$	$4x^3 + xy^2 = 5xy$ $12x^2 + x\left(2y\frac{dy}{dx}\right) + y^2 = 5x\frac{dy}{dx} + 5y$ $\frac{dy}{dx}(2xy - 5x) = 5y - y^2 - 12x^2$ $\frac{dy}{dx} = \frac{5y - y^2 - 12x^2}{2xy - 5x}$ At P, $y = x$ Subst $y = x$ into curve : $4x^3 + x^3 = 5x^2$ $x^2(x - 1) = 0$ $x = 0 \text{ (N.A.) or } x = 1$ Subst $x = 1$ and $y = 1$ into $\frac{dy}{dx}$: $\frac{dy}{dx} = \frac{8}{3}$ Equation of tangent to the curve at P is $y - 1 = \frac{8}{3}(x - 1)$ $y = \frac{8}{3}x - \frac{5}{3}$ or $3y = 8x - 5$
5	[Maximum mark: 9]		
	(a)	About half got this correct. Some tried to fit singles in between couples. Qn did not say singles cannot be together	C_1, C_2, C_3, C_4, M, W No of ways = $6! \times 2^4$ $= 720 \times 16$ $= 11520$

	(b)	Fairly well done. Some wrongly took last term as ar^{k+1}	Let P_n be the statement: $S_n = \frac{a(r^n-1)}{r-1}$ $P_1: S_1 = \frac{a(r^1-1)}{r-1} = a$ Hence P_1 is true. Assume P_k is true. $S_k = \frac{a(r^k-1)}{r-1}$ $P_{k+1}: S_{k+1} = S_k + u_{k+1}$ $S_{k+1} = \frac{a(r^k-1)}{r-1} + ar^k$ $= \frac{ar^k - a + ar^k(r-1)}{r-1}$ $= \frac{a(r^{k+1}-1)}{r-1}$ $\therefore P_{k+1}$ is true. P_1 and P_k are true $\Rightarrow P_{k+1}$ is true, $\therefore$ By Mathematical Induction, P_n is true for all $n \in \mathbb{Z}^+$
6	[Maximum mark: 8]		
	(i)	Mostly well done except a handful who went with memory work and got the wrong formula $(\alpha + \beta + \gamma)^2$	$2x^3 + x^2 - 5x + 3 = 0$ $\alpha + \beta + \gamma = -\frac{1}{2}$ $\alpha\beta + \alpha\gamma + \beta\gamma = -\frac{5}{2}$ $\alpha\beta\gamma = -\frac{3}{2}$ $(\alpha + \beta + \gamma)^2 = (\alpha + \beta)^2 + 2(\alpha + \beta)\gamma + \gamma^2$ $(\alpha + \beta + \gamma)^2 = \alpha^2 + \beta^2 + \gamma^2 + 2(\alpha\beta + \alpha\gamma + \beta\gamma)$ $\left(-\frac{1}{2}\right)^2 = \alpha^2 + \beta^2 + \gamma^2 + 2\left(-\frac{5}{2}\right)$ $\alpha^2 + \beta^2 + \gamma^2 = \frac{21}{4}$
	(ii)	Both methods were equally popular with the usual careless mistakes	$\{y - (\alpha - 1)\}\{y - (\beta - 1)\}\{y - (\gamma - 1)\}$ $= \{(y + 1) - \alpha\}\{(y + 1) - \beta\}\{(y + 1) - \gamma\}$ Subst. $x = y + 1$ into $2x^3 + x^2 - 5x + 3 = 0$ $2(y + 1)^3 + (y + 1)^2 - 5(y + 1) + 3 = 0$ $2(y^3 + 3y^2 + 3y + 1) + y^2 + 2y + 1 - 5y - 5 + 3 = 0$ $2y^3 + 7y^2 + 3y + 1 = 0$ Or $2x^3 + 7x^2 + 3x + 1 = 0$ Alternatively, $\alpha - 1 + \beta - 1 + \gamma - 1 = -\frac{1}{2} - 3 = -\frac{7}{2}$ $(\alpha - 1)(\beta - 1) + (\alpha - 1)(\gamma - 1) + (\beta - 1)(\gamma - 1)$ $= (\alpha\beta + \alpha\gamma + \beta\gamma) - 2(\alpha + \beta + \gamma) + 3$ $= -\frac{5}{2} - 2\left(-\frac{1}{2}\right) + 3$

			$= \frac{3}{2}$ $(\alpha - 1)(\beta - 1)(\gamma - 1)$ $= \alpha\beta\gamma - (\alpha\beta + \alpha\gamma + \beta\gamma) + (\alpha + \beta + \gamma) - 1$ $= -\frac{3}{2} - \left(-\frac{5}{2}\right) + \left(-\frac{1}{2}\right) - 1$ $= -\frac{1}{2}$ Equation is $x^3 - \left(-\frac{7}{2}\right)x^2 + \frac{3}{2}x - \left(-\frac{1}{2}\right) = 0$ $2x^3 + 7x^2 + 3x + 1 = 0$
7	[Maximum mark: 6]		
	(i)		$\sin \frac{\pi}{12} = \sin \left(\frac{\pi}{3} - \frac{\pi}{4} \right)$ $= \sin \frac{\pi}{3} \cos \frac{\pi}{4} - \cos \frac{\pi}{3} \sin \frac{\pi}{4}$ $= \frac{\sqrt{3}}{2} \times \frac{\sqrt{2}}{2} - \frac{1}{2} \times \frac{\sqrt{2}}{2}$ $= \frac{\sqrt{6} - \sqrt{2}}{4}$ Hence $\arcsin \left(\frac{\sqrt{6} - \sqrt{2}}{4} \right) = \frac{\pi}{12}$
	(ii)	Most not done using complementary angles	$x = \cos \frac{5\pi}{12} = \sin \frac{\pi}{12}$ $= \frac{\sqrt{6} - \sqrt{2}}{4}$
8	[Maximum mark: 6]		
		Fairly well done	 A, B, C, D

			Asymptote at $y = 0$ Shape of graph
9	[Maximum mark: 18]		
	(a)	(i) Many did not present answer as a single translation	$g(x) = x(x - 2) = x^2 - 2x$ $= (x - 1)^2 - 1$ x^2 is translated $\begin{pmatrix} 1 \\ 0 \end{pmatrix}$ to $(x - 1)^2$ and then translated $\begin{pmatrix} 0 \\ -1 \end{pmatrix}$ to $(x - 1)^2 - 1$ Transformation is translation $\begin{pmatrix} 1 \\ -1 \end{pmatrix}$
		(ii) A few did not know how to do a reciprocal graph	 $A'(-1.24, 0.25), B'(3.24, 0.25), C'(-0.414, 1), D'(2.41, 1), E'(1, -1)$
	(b)	(i) Not many got the range of k correct	$h: x \rightarrow (x - 1)^2 + 2, x \in R, x \geq 1$ $k: x \rightarrow -2x - 3, x \geq -2$ $R_k =]-\infty, 1]$ which is not a subset of the domain of $h(x)$ for $hk(x)$ to exist.
	(b)	(ii) Most could solve this	$hk(x) = h(ax + b)$ $4x^2 + 16x + 18 = (ax + b - 1)^2 + 2$ $4x^2 + 16x + 18 = (ax + b)^2 - 2(ax + b) + 1 + 2$ $4x^2 + 16x + 18 = (ax)^2 + 2abx + b^2 - 2ax - 2b + 3$ Comparing the constant terms: $b^2 - 2b + 3 = 18$ $b^2 - 2b - 15 = 0$ $(b - 5)(b + 3) = 0$ $b = 5, -3$ (N.A.)

			Also, comparing coefficients of x: $2ab - 2a = 16$ $2a(b - 1) = 16$ $a = 2$
	(c)	Many did not reject the positive answer and most did not get the domain correct	Let $y = \frac{4}{(2x-3)^2+1}$ $y(2x-3)^2 = 4-y$ $2x-3 = \pm \sqrt{\frac{4-y}{y}}$ $x = \frac{1}{2} \left[3 \pm \sqrt{\frac{4-y}{y}} \right]$ $p^{-1}(x) = \frac{3}{2} - \frac{1}{2} \sqrt{\frac{4-x}{x}} \text{ since } R_{p^{-1}} = D_p$ $p^{-1}(x) = \frac{3}{2} - \frac{1}{2} \sqrt{\frac{4-x}{x}}, 0 < x \leq 4$
10	[Maximum mark: 16]		
	(a)	(i) careless	Vector perpendicular to both lines, $\mathbf{n} = \begin{pmatrix} 3 \\ 2 \\ -2 \end{pmatrix} \times \begin{pmatrix} -3 \\ 4 \\ -1 \end{pmatrix} = 3 \begin{pmatrix} 2 \\ 3 \\ 6 \end{pmatrix}$
		(ii) Some took AB as the shortest distance	Let A be the point (-3, -4, 6) and B be the point (4, -7, -3). $\vec{AB} = \begin{pmatrix} 4 \\ -7 \\ -3 \end{pmatrix} - \begin{pmatrix} -3 \\ -4 \\ 6 \end{pmatrix} = \begin{pmatrix} 7 \\ -3 \\ -9 \end{pmatrix}$ Shortest distance between the skew lines $= \frac{\left \begin{pmatrix} 7 \\ -3 \\ -9 \end{pmatrix} \cdot \begin{pmatrix} 2 \\ 3 \\ 6 \end{pmatrix} \right }{\sqrt{2^2 + 3^2 + 6^2}}$ $= \frac{ 7 \times 2 + (-3) \times 3 + (-9) \times 6 }{7}$ $= 7$ Or Plane containing π_1 $\mathbf{r}_1 \cdot \begin{pmatrix} 2 \\ 3 \\ 6 \end{pmatrix} = \begin{pmatrix} -3 \\ -4 \\ 6 \end{pmatrix} \cdot \begin{pmatrix} 2 \\ 3 \\ 6 \end{pmatrix} = -18$ Plane containing π_2 $\mathbf{r}_2 \cdot \begin{pmatrix} 2 \\ 3 \\ 6 \end{pmatrix} = \begin{pmatrix} 4 \\ -7 \\ -3 \end{pmatrix} \cdot \begin{pmatrix} 2 \\ 3 \\ 6 \end{pmatrix} = -31$ Shortest distance between the skew lines = perpendicular distance between parallel planes

			$= \frac{ 18 - (-31) }{\left\ \begin{pmatrix} 2 \\ 3 \\ 6 \end{pmatrix} \right\ } = \frac{49}{\sqrt{2^2 + 3^2 + 6^2}} = \frac{49}{\sqrt{49}} = 7 \text{ units}$
	(b)	(i) Good	$\mathbf{p} = \begin{pmatrix} 1 \\ 2 \\ -1 \end{pmatrix} + t \begin{pmatrix} 1 \\ -2 \\ 3 \end{pmatrix}$ At $t = 0$, $\mathbf{p} = \begin{pmatrix} 1 \\ 2 \\ -1 \end{pmatrix}$ $\therefore P(1, 2, -1)$
	(b)	(ii) some switched cartesian to vector form instead of working the other way round	$x = 1 + t \Rightarrow t = x - 1$ $y = 2 - 2t \Rightarrow t = \frac{2 - y}{2}$ $z = 3t - 1 \Rightarrow t = \frac{z + 1}{3}$ $\therefore x - 1 = \frac{2 - y}{2} = \frac{z + 1}{3}$
	(b)	(iii)(a) Good	$2(1 + t) + (2 - 2t) + 3t - 1 = 6$ $t = 1$
		(iii) (b) Mostly well done	At $t = 1$, $\mathbf{p} = \begin{pmatrix} 1 \\ 2 \\ -1 \end{pmatrix} + \begin{pmatrix} 1 \\ -2 \\ 3 \end{pmatrix} = \begin{pmatrix} 2 \\ 0 \\ 2 \end{pmatrix}$ Coordinates of P are (2, 0, 2)
		(iii) (c) Mostly well done	Distance travelled = $\left\ \begin{pmatrix} 2 \\ 0 \\ 2 \end{pmatrix} - \begin{pmatrix} 1 \\ 2 \\ -1 \end{pmatrix} \right\ = \left\ \begin{pmatrix} 1 \\ -2 \\ 3 \end{pmatrix} \right\$ $= \sqrt{1^2 + (-2)^2 + 3^2} = \sqrt{14}$
11	[Maximum mark: 16]		
	(a)	Poorly done. Correct ones did not remove $\frac{1}{1+w^3}$	$(1 - z)^6 - z^6 = 0$ $\left(\frac{1 - z}{z} \right)^6 = 1$ $1, w, w^2, w^3, w^4$ and w^5 are solutions of the complex equation $z^6 = 1$ Let $w = \frac{1 - z}{z}$, $z = \frac{1}{1 + w}$ $z = \frac{1}{1 + 1}, \quad \frac{1}{1 + w}, \quad \frac{1}{1 + w^2}, \quad \frac{1}{1 + w^3} \text{ (N.A.)}, \quad \frac{1}{1 + w^4},$ $\therefore z = \frac{1}{2}, \quad \frac{1}{1 + w}, \quad \frac{1}{1 + w^2}, \quad \frac{1}{1 + w^4}, \quad \frac{1}{1 + w^5}$

	(b)	(i) some had problem with the argument	$[\sqrt{3} - i] = \sqrt{3 + 1} = 2$ $\arg(\sqrt{3} - i) = -\frac{\pi}{6}$ Hence $\sqrt{3} - i = 2\text{cis}\left(-\frac{\pi}{6}\right)$ By de Moivre's Theorem, $(\sqrt{3} - i)^n = 2^n \text{cis}\left(-\frac{n\pi}{6}\right)$ $= 2^n \left(\cos\frac{1}{6}n\pi - i\sin\frac{1}{6}n\pi\right)$
		(ii) most could not give final answers	$(\sqrt{3} - i)^n = 2^n \left(\cos\frac{1}{6}n\pi - i\sin\frac{1}{6}n\pi\right)$ is real and negative $\Rightarrow \sin\frac{n\pi}{6} = 0$ and $\cos\frac{n\pi}{6} < 0$ $n = 0, 6, 12, 18, 24, \dots$ and $n = 6, 18, 30, 42, \dots$ Hence $n = 6, 18, 30, 42, \dots$ Or $n = 6 \times 1, 6 \times 3, 6 \times 5, 6 \times 7, \dots$
		(iii) numerous different errors	Subst. $\sqrt{3} - i$ into $z^9 + 16(1 + i)z^3 + a + ib = 0$, $2^9 \left(\cos\frac{3}{2}\pi - i\sin\frac{3}{2}\pi\right) + 16(1 + i) \left[2^3 \left(\cos\frac{1}{2}\pi - i\sin\frac{1}{2}\pi\right)\right] + a + ib = 0$ $512(i) + 16(1 + i) \times 8(-i) + a + ib = 0$ $512(i) + 128(-i + 1) + a + ib = 0$ $a + ib = -128 - 384i$ $\therefore a = -128 \text{ and } b = -384$
